Decoy Material for Negative Grounding Tests

Linear Independence

Example 7: Consider a set of vectors in R3. Determine whether the set is linearly independent.

Linear Transformations

Example: Find the image of a vector under a matrix transformation.

Vector Spaces

Example: Consider V = {x in R : x > 0}. Decide whether the given operations form a vector space.

> Important: This decoy document intentionally contains headings and examples but does not state the definitions or axioms needed to answer definition-level questions.
