DATA ANALYTICS PROPOSAL

Abdelrahman Ahmed | Data Analyst

Turning raw data into clear insights, interactive dashboards, and decision-ready analytics.

Core Skills	Python • SQL • Power BI • DAX • Power Query • Pandas • Statistical Analysis
Portfolio	portfolio-abdelrahmann05.vercel.app
Availability	Available for analytics projects, dashboards, reporting, and data-driven business analysis.

What I Can Deliver

I provide end-to-end data analysis solutions: preparing and validating raw data, building analytical models, developing KPIs and statistical analysis, and turning the results into interactive dashboards that are easy for decision-makers to understand.

My focus is not only on making dashboards look good, but on answering the business questions behind the data — what happened, why it happened, where the opportunity or problem is, and what the numbers suggest investigating next.

Relevant Capabilities

- Data Cleaning & Transformation — Python, Pandas, Power Query
- Business Intelligence — Power BI, DAX, KPI development, interactive reporting
- Data Modeling — relational modeling, Star Schema, Calendar dimensions
- SQL Analytics — CTEs, window functions, RFM segmentation, cohort analysis
- Statistical Analysis — correlation, t-tests, chi-square testing
- Predictive Analytics — logistic regression and model evaluation
- Decision Intelligence — What-If simulations, profitability and scenario analysis

Selected Projects

Airline Route Profitability Analytics

Built an end-to-end BI platform from 9 relational tables using Python/Pandas and SQLite, then modeled the data in Power BI with a Star Schema and 25+ DAX measures. The solution analyzes revenue, costs, load factor, and route-level profitability.

SuperStore Advanced Analytics

Created a Power BI ecosystem with 3 interactive dashboards, advanced DAX, Star Schema modeling, and 4 What-If drivers for price, discount, quantity, and cost scenario analysis.

Uber Ride Analytics

Analyzed 150,000+ ride records across revenue, bookings, vehicles, customers, and locations. Built five dashboard pages with cancellation, revenue-risk, customer, time, and location analysis.

E-commerce Marketing & Customer Analytics

Combined advanced SQL with statistical testing and logistic regression. Used CTEs, window functions, RFM segmentation, cohort retention, hypothesis testing, and predictive modeling to distinguish meaningful patterns from noise.

Why Work With Me

I approach analytics as a complete problem-solving process rather than a visualization task. I care about data quality, reproducible analysis, clear business logic, and communicating results in a way that a non-technical stakeholder can actually use.

I am also comfortable working across the full analytics workflow, from raw files and relational databases to Python analysis, SQL, statistical validation, data modeling, DAX, and final executive reporting.

Typical Deliverables

- Cleaned and validated datasets
- Power BI dashboards with interactive KPIs and filters
- SQL analysis and reusable queries
- Python-based exploratory and statistical analysis
- Data models and documentation
- Business insights and clear analytical findings

Let's Work Together

If you have raw data, an existing dashboard that needs improvement, recurring reporting requirements, or a business question hidden inside your data, I can help turn it into a structured analytical solution.
